1      **CLAIMS**

- 2
- 3      1. One or more computer readable media having stored thereon a
- 4      plurality of instructions that, when executed by one or more processors, causes the
- 5      one or more processors to perform acts including:
- 6            receiving an initial image selection;
- 7            generating a plurality of query vectors by extracting, for each query vector,
- 8      one of a plurality of low-level features from the initial image selection;
- 9            selecting a set of potentially relevant images based at least in part on
- 10     distances between the plurality of query vectors and a plurality of feature vectors
- 11     corresponding to low-level features of a plurality of images;
- 12            receiving feedback regarding the relevance of one or more images of the set
- 13     of potentially relevant images;
- 14            generating a new plurality of query vectors based at least in part on the
- 15     feedback;
- 16            generating a weighting of feature elements based at least in part on the
- 17     feedback; and
- 18            selecting a new set of potentially relevant images based at least in part on
- 19     both the weighting of feature elements and distances between the new plurality of
- 20     query vectors and the plurality of feature vectors.
- 21
- 22
- 23
- 24
- 25

1           **2.** One or more computer readable media as recited in claim 1, wherein  
2 the selecting a new set of potentially relevant images comprises using a matrix in  
3 determining the distance between one of the new plurality of query vectors and  
4 one of the plurality of feature vectors, and further comprising dynamically  
5 selecting the matrix based on both a number of images in the set of potentially  
6 relevant images for which relevance feedback was input and a number of feature  
7 elements in the one feature vector.

8

9           **3.** One or more computer readable media as recited in claim 2, wherein  
10 the dynamically selecting comprises using a diagonal matrix if the number of  
11 images in the set of potentially relevant images for which relevance feedback was  
12 input is less than the number of feature elements in the one feature vector, and  
13 otherwise using a full matrix.

14

15           **4.** One or more computer readable media as recited in claim 2, wherein  
16 the dynamically selecting comprises:

17                 if the number of images in the set of potentially relevant images for which  
18 relevance feedback was input is not less than the number of feature elements in the  
19 one feature vector, then using one matrix that transforms the query vector and the  
20 one feature vector to a higher-level feature space and then using another matrix  
21 that assigns a weight to each element of the transformed query vector and the  
22 transformed feature vector; and

23                 if the number of images in the set of potentially relevant images is less than  
24 the number of feature elements in the one feature vector, then using a matrix that  
25 assigns a weight to each element of the query vector and the one feature vector.

1  
2       5. One or more computer readable media as recited in claim 2, wherein  
3        $X$  represents an image matrix that is generated by stacking  $N$  feature vectors  
4       corresponding to the set of potentially relevant images for which relevance  
5       feedback was received and resulting in an ( $N \times K$ ) matrix,  $C$  represents a  
6       weighted covariance matrix of  $X$ ,  $\det(C)$  represents the matrix determinant of  $C$ ,  
7       and the matrix comprises a full matrix ( $W^*$ ) that is generated as follows:

8       
$$W^* = (\det(C))^{\frac{1}{K}} C^{-1}.$$

9  
10  
11       6. One or more computer readable media as recited in claim 2, wherein  
12        $w_{kk}$  represents the  $kk^{\text{th}}$  element of matrix  $W$ ,  $x_k$  represents the  $k^{\text{th}}$  feature element,  
13        $\sigma_k$  represents the standard deviation of the sequence of  $x_k$ 's, the matrix comprises  
14       a diagonal matrix with each diagonal element ( $w_{kk}$ ) being generated as follows:

15       
$$w_{kk} = \frac{1}{\sigma_k}$$

1           7. One or more computer readable media as recited in claim 1, wherein  
2         $N$  represents the number of images in the set of potentially relevant images for  
3        which relevance feedback has been received,  $\pi_n$  represents the relevance of image  
4         $n$  in the set of images,  $\vec{\pi}^T$  represents a transposition of a vector generated by  
5        concatenating the individual  $\pi_n$  values, and  $X$  represents an image matrix that is  
6        generated by stacking  $N$  training vectors corresponding to the set of potentially  
7        relevant images into a matrix, and wherein each new query vector ( $\vec{q}$ ) of the new  
8        plurality of query vectors is generated as follows:

$$9 \quad \vec{q} = \frac{\vec{\pi}^T X}{\sum_{n=1}^N \pi_n}.$$

10

11

12

13           8. One or more computer readable media as recited in claim 1, wherein  
14         $f_i$  represents a summation, over the images in the set of potentially relevant  
15        images, of a product of a relevance of the image and a distance between the query  
16        vector and the feature vector, and wherein the selecting a new set of potentially  
17        relevant images comprises combining, for each image, a weighted distance  
18        between the plurality of query vectors and the plurality of feature vectors, and  
19        wherein the weight ( $u_i$ ) for each of a plurality ( $I$ ) of distances between a query  
20        vector and a corresponding feature vector is calculated as:

$$21 \quad u_i = \sqrt{\sum_{j=1}^I \frac{f_j}{f_i}}.$$

22

23           9. One or more computer readable media as recited in claim 1, wherein  
24        the receiving feedback comprises receiving feedback from a user.

25

1           **10.** One or more computer readable media as recited in claim 1, wherein  
2 the low-level features include: a color moments feature, a wavelet based texture  
3 feature, and a water-fill edge feature.

4

5           **11.** A method of selecting between two types of matrixes to be used to  
6 weight, based on relevance feedback, a plurality of feature elements for image  
7 retrieval, the method comprising:

8                 selecting one of the two types of matrixes based on both a number of  
9 previously retrieved relevant images and a length of a feature vector including the  
10 plurality of feature elements.

11

12           **12.** A method as recited in claim 11, wherein the selecting comprises  
13 selecting one of the two types of matrixes based on both a number of previously  
14 retrieved potentially relevant images which were identified by a user as being  
15 relevant, and the length of the feature vector including the plurality of feature  
16 elements.

17

18           **13.** A method as recited in claim 11, wherein the plurality of feature  
19 elements are all elements of the same feature.

20

21           **14.** A method as recited in claim 11, wherein the selecting comprises  
22 using a first type of matrix if the number of retrieved relevant images is less than  
23 the length of the feature vector, and otherwise using a second type of matrix.

1           15. A method as recited in claim 14, wherein the first type of matrix  
2 comprises a diagonal matrix and wherein the second type of matrix comprises a  
3 full matrix.

4

5           16. A method as recited in claim 11, wherein the selecting comprises  
6 using a first type of matrix if the length of the feature vector exceeds the number  
7 of retrieved relevant images by at least a threshold amount, and otherwise using a  
8 second type of matrix.

9

10          17. A method as recited in claim 16, wherein the first type of matrix  
11 comprises a full matrix and the second type of matrix comprises a diagonal matrix.

12

13          18. One or more computer readable media including a computer  
14 program that is executable by a processor to perform the method recited in claim  
15 11.

16

17          19. One or more computer readable media having stored thereon a  
18 plurality of instructions that, when executed by one or more processors, causes the  
19 one or more processors to perform acts including:

20                 comparing, for each of a plurality of images, a plurality of feature elements  
21 from a query vector to a plurality of feature elements from a feature vector  
22 corresponding to the image;

23                 identifying a number of potentially relevant images based on the  
24 comparing;

1 receiving user feedback regarding the relevancy of one or more of the  
2 potentially relevant images;

3 re-comparing, for each of the plurality of images, the plurality of feature  
4 elements from the query vector to the plurality of feature elements from the  
5 feature vector, including using a matrix to compare the feature elements and  
6 dynamically selecting a type of matrix to use based on both the user feedback and  
7 the number of the plurality of feature elements;

8 identifying a new set of potentially relevant images based on the re-  
9 comparing; and

10 presenting the new set of potentially relevant images to the user.

11  
12 **20.** One or more computer readable media as recited in claim 19,  
13 wherein the re-comparing comprises dynamically selecting the type of matrix to  
14 use based on both a number of the potentially relevant images for which user  
15 feedback has been received and the number of the plurality of feature elements.

16  
17 **21.** One or more computer readable media as recited in claim 19,  
18 wherein the dynamically weighting comprises using a first type of matrix if the  
19 number of retrieved relevant images is less than the length of the feature vector,  
20 and otherwise using a second type of matrix.

21  
22 **22.** One or more computer readable media as recited in 21, wherein the  
23 first type of matrix comprises a diagonal matrix and the second type of matrix  
24 comprises a full matrix.

1           **23.** A method comprising:

2           generating a query vector corresponding to a feature of one image;

3           identifying a feature vector corresponding to the feature of another image;

4           identifying a number of training samples for which relevance feedback has  
5           been received;

6           if the number of training samples either equals or exceeds a threshold  
7           amount, then determining a distance between the query vector and the feature  
8           vector including transforming the query vector and the feature vector to a higher-  
9           level feature space and then assigning a weight to each element of the transformed  
10          query vector and the transformed feature vector; and

11          if the number of training samples does not exceed the threshold amount,  
12          then determining the distance between the query vector and the feature vector  
13          including assigning a weight to each element of the query vector and the feature  
14          vector.

15  
16          **24.** A method as recited in claim 23, wherein the feature vector includes  
17          a plurality of feature elements and wherein the threshold amount comprises the  
18          number of feature elements in the feature vector.

19  
20          **25.** A method as recited in claim 23, wherein if the number of training  
21          samples either equals or exceeds the threshold amount, then determining the  
22          distance ( $g$ ), where  $P$  is a mapping matrix,  $\vec{q}$  is the query vector,  $\vec{x}$  is the feature  
23          vector, and  $\Lambda$  is a weighting matrix, as:

24          
$$g = (\vec{P}(\vec{q} - \vec{x}))^T \Lambda (\vec{P}(\vec{q} - \vec{x})).$$

1           **26.** A method as recited in claim 23, wherein if the number of training  
2 samples does not exceed the threshold amount, then determining the distance ( $g$ ),  
3 where  $\vec{q}$  is the query vector,  $\vec{x}$  is the feature vector, and  $\Lambda$  is a weighting matrix,  
4 as:

5           
$$g = (\vec{q} - \vec{x})^T \Lambda (\vec{q} - \vec{x}).$$

6  
7           **27.** A method as recited in claim 23, further comprising:  
8           repeating the generating, identifying of the feature vector, identifying of the  
9 number of training samples, and the determining for each of a plurality of features;  
10 and

11           identifying how closely the image and the other image match each other by  
12 combining the distances between the query vectors and the feature vectors for the  
13 plurality of features.

14  
15           **28.** A method as recited in claim 27, wherein the identifying comprises  
16 calculating a weighted summation of each of the individual distances for each of  
17 the plurality of features.

18  
19           **29.** One or more computer readable media including a computer  
20 program that is executable by a processor to perform the method recited in claim  
21 23.

22  
23           **30.** A system comprising:  
24           a query vector generator to generate a query vector corresponding to a  
25 feature of one image;

1 a comparator, coupled to the query vector generator, to,

2 identify a feature vector corresponding to the feature of another  
3 image,

4 identify a number of training samples for which relevance feedback  
5 has been received,

6 if the number of training samples either equals or exceeds a  
7 threshold amount, then to determine a distance between the query vector  
8 and the feature vector including transforming the query vector and the  
9 feature vector to a higher-level feature space and then assigning a weight to  
10 each element of the transformed query vector and the transformed feature  
11 vector, and

12 if the number of training samples does not exceed the threshold  
13 amount, then to determine the distance between the query vector and the  
14 feature vector including assigning a weight to each element of the query  
15 vector and the feature vector.

16

17 **31. A method comprising:**

18 for one of a plurality of images and each of a plurality of features,

19 generating, based on the set of search criteria, a query vector for the  
20 feature,

21 identifying a feature vector, corresponding to the image, for the  
22 feature, and

23 determining how closely the feature vector matches the query vector;

1 determining how closely the image matches the set of search criteria based  
2 on how closely, for the plurality of features, the feature vectors match the query  
3 vectors.

4

5       **32.** A method as recited in claim 31, wherein generating the query  
6 vector comprises generating the query vector based at least in part on user  
7 relevance feedback regarding how relevant images previously displayed to a user  
8 were.

9

10      **33.** A method as recited in claim 31, wherein identifying the feature  
11 vector comprises:

12            identifying a low-level feature vector corresponding to the feature; and  
13            mapping the low-level feature vector to a higher level feature space.

14

15      **34.** A method as recited in claim 33, wherein the identifying the feature  
16 vector further comprises incorporating, into the mapping, relevance feedback.

17

18      **35.** A method as recited in claim 31, wherein the initial search criteria  
19 comprises an image.

1           **36.** A method as recited in claim 31, wherein the determining how  
2 closely the feature vector matches the query vector comprises determining a  
3 distance between the feature vector and the query vector, and wherein the  
4 determining how closely the image matches the set of search criteria comprises  
5 calculating a weighted summation of each of the individual distances between the  
6 feature vectors and the query vectors.

7  
8           **37.** A method as recited in claim 36, wherein the calculating a weighted  
9 summation comprises calculating the weighted summation based at least in part on  
10 user relevance feedback regarding how relevant images previously displayed to a  
11 user were.

12  
13           **38.** One or more computer readable media including a computer  
14 program that is executable by a processor to perform the method recited in claim  
15 31.

16  
17           **39.** One or more computer readable media having stored thereon a  
18 plurality of instructions that, when executed by one or more processors, causes the  
19 one or more processors to perform acts including:

20                 identifying a plurality of query vectors for one image, each query vector  
21 corresponding to one of a plurality of features;

22                 identifying a plurality of feature vectors for the other image, each feature  
23 vector corresponding to one of the plurality of features;

24                 for each feature, determining a distance between the corresponding query  
25 vector and the corresponding feature vector; and

1 combining the distances to generate a value representing an overall distance  
2 between the two images.

3

4 **40.** One or more computer readable media as recited in claim 39,  
5 wherein the identifying the plurality of query vectors comprises extracting the  
6 plurality of query vectors from the image.

7

8 **41.** One or more computer readable media as recited in claim 39,  
9 wherein the identifying the plurality of query vectors comprises generating the  
10 plurality of query vectors based at least in part on user relevance feedback  
11 regarding how relevant images previously displayed to a user were.

12

13 **42.** One or more computer readable media as recited in claim 39,  
14 wherein the determining the distance between the corresponding query vector and  
15 the corresponding feature vector includes incorporating, into the determining, user  
16 relevance feedback regarding how relevant images previously displayed to a user  
17 were.

18

19 **43.** One or more computer readable media as recited in claim 39,  
20 wherein the combining the distances comprises calculating a weighted summation  
21 of each of the individual distances between the feature vectors and the query  
22 vectors.

1           **44.** One or more computer readable media as recited in claim 43,  
2 wherein the calculating a weighted summation comprises calculating the weighted  
3 summation based at least in part on user relevance feedback regarding how  
4 relevant images previously displayed to a user were.

5  
6           **45.** A system comprising:  
7            a query vector generator to identify a query vector, for each of a plurality of  
8 features, corresponding to one image;

9            a comparator, coupled to the query vector generator, to,  
10            identify, for each of a plurality of features of another image, a  
11            feature vector for the feature,

12            determine, for each of the plurality of features, how closely the  
13            feature vector matches the query vector, and

14            determine how closely the image matches the other based on how  
15            closely, for the plurality of features, the feature vectors match the query  
16            vectors.

17  
18           **46.** A method of generating a query vector to compare to a feature  
19           vector of another image, the method comprising:

20           receiving feedback regarding the relevance of each image of a set of  
21           images;

22           wherein  $N$  represents the number of images in the set of images for which  
23           user relevance feedback has been received,  $\pi_n$  represents the relevance of image  $n$   
24           in the set of images,  $\pi \rightarrow^T$  represents a transposition of a vector generated by  
25           concatenating the individual  $\pi_n$  values, and  $X$  represents an image matrix that is

1 generated by stacking  $N$  training vectors corresponding to the set of images into a  
2 matrix; and

3 generating a query vector ( $\vec{q}$ ) corresponding to one of a plurality of  
4 features as follows:

$$5 \quad \vec{q} = \frac{\vec{\pi}^T X}{\sum_{n=1}^N \pi_n}$$

6

7

8

9 47. One or more computer readable media including a computer  
10 program that is executable by a processor to perform the method recited in claim  
11 46.

12

13 48. A method of generating a weight to apply to distances between  
14 query vectors and feature vectors when combining the distances, the method  
15 comprising:

16 receiving feedback regarding the relevance of each image of a set of  
17 images;

18 wherein  $f_i$  represents a summation, over the images in the set of images, of  
19 a product of a relevance of the image and a distance between the query vector and  
20 the feature vector; and

21 generating a weight ( $u_i$ ) for each of a plurality ( $I$ ) of distances between a  
22 query vector corresponding to one of a plurality ( $I$ ) of features and a feature  
23 vector corresponding to the one of the plurality ( $I$ ) of features as:

$$24 \quad u_i = \sqrt{\sum_{j=1}^I f_j / f_i}$$

25

1  
2       **49.** One or more computer readable media including a computer  
3 program that is executable by a processor to perform the method recited in claim  
4

5       **48.**

6       **50.** A system comprising:

7           a client device;

8           a collection of a plurality of images;

9           an image server, coupled to the client device and the collection of a  
10 plurality of images, the image server to receive image retrieval requests from the  
11 client device and to,

12           receive an initial image selection from the client device,

13           generate a plurality of query vectors by extracting, for each query  
14 vector, one of a plurality of low-level features from the initial image  
15 selection,

16           select a set of potentially relevant images based at least in part on  
17 distances between the plurality of query vectors and a plurality of feature  
18 vectors corresponding to low-level features of a plurality of images,

19           receive feedback regarding the relevance of one or more images of  
20 the set of potentially relevant images,

21           generate a new plurality of query vectors based at least in part on the  
22 feedback,

23           generate a weighting of feature elements based at least in part on the  
24 feedback, and

1 select a new set of potentially relevant images based at least in part  
2 on both the weighting of feature elements and distances between the new  
3 plurality of query vectors and the plurality of feature vectors.
